

Translations:Elevage de grillons comestibles/42/en

The amount of greenhouse gases produced by insect farming is significantly less than that of livestock. From a logistical point of view, cricket farming has many advantages over large livestock farming: the area of land occupied is smaller, possible in urban areas. The low need for investment in infrastructure can enable poorer populations to start micro-farming, they can be raised on substrates made up of agricultural waste and fed with organic by-products.
