Commentaires

## Matériaux

- 500 ml White vinegar
- 35 Baking soda
- 500 ml Boiling water

## Outils

- Coffee filter
- Spoon
- Saucepans
- Sachet
- Funnel
- Trombone

## Étape 1 -

Put 500mL of vinegar in a container and gently add the bicarbonate of soda (you will see a gas being released as it foams, this is carbon dioxide).

## Étape 2 -

Pour this solution into the 500mL of boiling water in the pan and allow the solution to evaporate: you will notice crystals forming at the bottom of the pan.

## Étape 3 -

Remove the crystals from the bottom of the saucepan and crush them so that they fit into the container (in this case, the Pompotes flask).

## Étape 4 -

Bring the water to the boil and melt the mixture in the flask at a low temperature until the mixture is liquid.

## Étape 5 -

Leave the sachet to stand in the open air, avoiding any shocks.

## Étape 6 -

Add the paperclip and then stir the sachet to crystallize the sodium acetate which, being exothermic, will provide us with heat!

## Étape 7 -

To reuse it, repeat steps 4 and 5.
