

Translations:Champignon Inoculation d'une culture liquide/156/en

- Turn on your hood and place tealights all around your work area.
- Take your container of inoculated grains, the mycelium must have colonized all the grains!
- Clean the outside of the inoculated grain container and the chilled substrate container with alcohol.
- Open your containers in the center of the work area.
- Break your colonized grains to make lumps, be careful that each instrument in contact is cleaned!
- Fill your substrate container with your inoculated seeds. Close it immediately (with the clothespins, expelling the air in the case of a bag).
- Replace the containers in a room at a temperature between 20 and 23°C for three weeks. Loan of a radiator in your bathroom is a clever solution!
