

Translations:Culture de la spiruline/36/en

It is possible to seed his pond with concentrated spirulina. Unlike pressed spirulina, spirulina has not been separated from its living environment. It has a very high concentration, it must be quickly transferred to its new growing basin. It should not remain more than 12 hours in transfer.

- Gently transfer the concentrated spirulina into the basin, preferably in the evening. It is possible to pour the contents of the canister directly into the pond gently or to use an aquarium pump or a natural siphon.
- Check the concentration and add culture medium if it is higher than 3 %.
- Ensure good agitation during the first 4 days (but not at night)
- Shade the pool for the first few days
