

# Translations:Culture de la spiruline/48/en

---

Over time the basin becomes loaded with organic matter (dead spirulina, other algae...). In order to keep a healthy growing environment, it is necessary to replace  $\frac{1}{4}$  once or twice a year:

- Collect the spirulina above a tank and not above the growing tank. Thus the culture medium does not return to the pond.
- Make a new growing medium as seen in the 'growth phase' part and add it to the pond.
- Get rid of the old growing medium (undiluted it can be used as a weed killer, diluted to 10% it enriches the compost, otherwise put it in the drain).
