---

- According to the diagram, make a triangle and its tracks/holes in a plywood of thickness 9mm. Each blade's base, on the outer surface of the triangle, is represented on the triangle. The outline of the central circle does not allow the pre-drilled to enter this area which will subsequently accommodate threaded rods. The lines parallel to the sides for pre-drills (for 5mm screws) are randomly defined. This triangle is used to assemble the propeller on the inner surface.
