

Translations:Fonctionnement, entretien et régénération de batteries au plomb/62/en

Battery not in use – Self-discharge: When a battery is not in use, it slowly discharges. This phenomenon depends on the type of battery and the temperature.

- o An unused open battery must be recharged every four months at room temperature (between 10-25°C).
- o An unused open battery must be kept permanently charged in temperatures below 0°C.
- o Sealed batteries can be left for up to 6 to 8 months without recharging at ambient temperature.
- o When a system containing batteries (RV, car, etc.) is not used for a long period, disconnect the batteries to avoid leakage currents.
