

Translations:Four à économie de bois/11/en

- Lay the bricks on the surface of the table without covering the hole. The surface must be the straightest and most horizontal possible.
- Lay the canister on the middle of the table, horizontally. It must be slightly raised so the air can circulate underneath.
- Build a cement-brick arch in order to cover the canister, leaving a 10 cm space around it. Leave a 10 cm hole on top of the arch for the passage of the flue.
- At the end of this stage, only the opening of the canister should be visible.
