

# Translations:Lampe solaire à batteries lithium récupérées/411/en

---

However, this waste has a high recycling potential. In particular, the lithium in the cells of computer batteries can be recovered and reused. When a computer battery does not work anymore, it is because one or more cells are defective, but some remain in good condition and can be reused. From these cells it is possible to create a separate battery, which can be used to power an electric drill, recharge your phone or be connected to a solar panel to operate a lamp. By associating several cells it is also possible to form batteries of storage of more important device.
