

Translations:Module de conservation/2/en

The fridge has become the first solution to preserve food. However, this environment is specific and does not correspond to most of fruits and vegetables. It's too cold and alters smells, tastes along with maturity. This preservation module reduces the size of your fridge and helps you controlling the way food preserves itself. It permits to give taster fruits, to mature them and avoid food waste. It values fresh fruits and vegetables, preserving them without energy, in different environments, according to their characteristics. For best preservation, food needs to be cared, not piled up to avoid crush, and looked after for their maturity.
