- Your Raspberry Pi is now powered on! There is no on/off button; your Raspberry Pi computer simply turns on when plugged into the power supply. The first time it turns on, the Raspberry Pi Operating System Setup Wizard appears. This helps you complete the configuration of your Raspberry Pi: connecting it to your Wi-Fi network, choosing the correct region and language settings, and so on (you can also change all these settings later). The wizard also installs all the bug and performance updates that have become available since the full version of Raspberry Pi OS that Raspberry Pi Imager installed on your microSD card.
