

Translations:Phytoépuration eaux usées/206/en

Whether collective sanitation or not, it is important to reaffirm that discarded sink water and the flush of the toilet are not to be the trash of the natural habitat. Whether used oils, paints, solvents, hydrocarbons (petroleum products), medicine, cleaning products...all involve serious risks for the environment, as they are addressed very little or not at all by major sanitation systems, whatever they may be. We must take responsibility for these products, specifically concerning the waste they leave and the risk of finding them in nature. Sanitation is not a waste bin!
