

Translations:Poelito - Poêle de masse semi-démontable/374/en-gb

The Poelito is a wood-burning inertia stove for small and/or non-fixed dwellings (e.g. motor homes, yurts, caravans, mobile homes, narrow boats etc.). Such dwellings have the following characteristics:

- They are less spacious inside and therefore only need a small amount of power to heat. Because of this, a conventional stove is often excessive as it heats the space up too quickly. It therefore needs to burn when it is not giving any real benefit which leads to pollution, soot deposits and poor performance.
- Inertia is low which means that there is very little mass that can absorb excess heat and later release it. It therefore gets cold quickly once the source of heat has gone. A storage heater is the perfect answer to these problems. It stores a vast amount of heat and only needs to be burning for 2 hours every 12 to 24 hours; therefore the fire needs to be maintained for less time and heat can be given out over longer periods.
