

# Translations:Pot de fleur/2/en

---

Plastic bottles, which are widely used, are ubiquitous waste products that have a damaging impact on the environment and human health. Their decomposition, spread over several centuries, leads to the pollution of soil, waterways and oceans. Faced with these harmful consequences, recycling plastic containers is emerging as a crucial solution. This approach facilitates the transformation of this waste into new products, such as articles of clothing, furniture, brooms, carpets, bags, containers, clotheslines, rafts and plant receptacles.) With this in mind, we've opted for up-cycling as a more environmentally-friendly approach. In fact, making flower pots from plastic bottles is a project that is both simple and accessible to everyone. All you need to do is use basic tools such as scissors (especially with children) or a cutter, as well as a dose of imagination, to help reduce the environmental footprint associated with this widespread plastic waste.
