

Translations:Savon à l'huile de coco/28/en

Soap is the basis of hygiene. Washing your hands regularly (and your body) limits the transport of harmful substances and bacteria. To meet this need, it is possible to make soap yourself with basic products. The chemical reaction to make a soap is called saponification and requires two reagents: a fat and a strong base. Here the fat will be coconut oil from the ripe nut (brown), and the strong base will be soda NaOH. This tutorial will teach you how to make soap from coconut.
