- It is best to feed the worm compost in phases: a 10L bucket with lid can be used to collect the waste (approximately 1 week's worth) before adding it into the system.

Then cover with a bed of 1cm (approx.) of straw. This is used as a shelter for the worms and is an area where they can reproduce before the next application.

- In order that waste breaks down correctly, the following conditions are required at the same time:
