

Translations:Phytoépuration eaux usées/127/en

Filters that are installed as such, thanks to the diversity of the filtering plants, play a part in the aesthetic appeal of gardens. What's more, they replicate wetlands, a necessary element in the development of natural life. Numerous helpers (insects, birds, amphibians...) return--it's a great step toward biodiversity. Phyto-purification is different from lagoon-based systems in that there is no water on the surface of the filters, but instead gravel--therefore, no risk of the proliferation of mosquitos.
