---

In the picture, you can see the bottom of the vertical feed pipe and the ash tray at the front and, behind, the pipe where the fire is lit . This together forms the burner. Towards the back, there are 2 pipes where the smoke is forced down. These are situated on either side of the pipe where the fire lit. These pipes join up underneath by means of a manifold which directs the smoke towards the back in the direction of the smoke exhaust which forms the manifold. Connection to the exhaust pipe is by means of a T with cap.
