

# Translations:Poelito - Poêle de masse semi-démontable/437/en-gb

---

The Poelito is a wood stove with inertia intended for small and/or light habitats (truck, yurt, caravan, mobile home, barge ...). These habitats are characterized by : - a small surface to be heated, thus a low heating power required. Therefore, a usual stove is often oversized because it is quickly too hot. The inhabitant uses it in slow motion, which induces clogging, pollution and mediocre performances. - a low inertia, i.e. little mass allowing to absorb the surplus heat to restore it later. It is therefore quickly cold after the heat sources are turned off. An accumulation stove is the perfect solution to these constraints. It stores a lot of heat, allowing only 2 hours of fire every 12 to 24 hours. This limits the amount of time needed to maintain the fire and allows heating for long periods.
